Here we are writing some multi-line text in Python and sending it to be printed out to PDF using a textobject.

Since we have line breaks in the

text, these breaks are not

ignored and the text is not run together as if it were one long string. The existing carriage returns and line feeds are respected, and lines of te

with the number of lines output equal to the number of lines in this multi-line block.

Goodbye, World

Hewwy

Hello World

Here we are writing some multi-line text in Python and sending it to be printed out to PDF using a Paragraph. Although we have line breaks in
the text, these are presumably ignored and the text is run together as if it were one long string. If so, then when the carriage returns and line feeds
are deleted, we should expect to see words slammed together where one line meets the other in this multi-line block
